

Seracal™

Instructions for tube feeding flush

1 Measure $\frac{1}{4}$ cup* (4 fl oz/120 mL) of water into a 1-cup or larger cup/container

2 Add $\frac{1}{4}$ cup* (level) of fluffed (do not pack down) Seracal powder to the water

3 Stir with a spoon or fork

4 Mix with a whisk or immersion blender until the mixture has no visible clumps (typically less than a minute)**

5 Pull up mixed solution into a syringe and flush into the tube port

6 Flush the tube with water afterward to ensure all Seracal is pushed through the tube

*If a smaller, more frequent flush bolus is desired, reduce to 2 oz (60 mL) water mixed with 2 tbsp of Seracal.

**If mixture sits longer than 3 minutes, mix again briefly.

If a patient is using Relizorb®, we recommend flushing Seracal separately and not through its cartridge.
